**Anthem Exclusive Innovations**

The STR Preamplifier includes the newest and most powerful generation of Anthem Room Correction (ARC), optimized for stereo performance. This proprietary calibration tool, with its easy-to-use interface, automatically shapes the acoustic signature of your speakers for the best possible sound quality in your unique listening space. This is especially important for the lower frequencies.

Other innovations include a high-resolution preamplifier and digital section, which supports asynchronous USB up to 32-bit/384 kHz PCM and DSD 2.8/5.6 MHz sources, and uses signal processing that employs 64-bit accumulation and feedback to preserve the finest detail in the music and to avoid degradation. The digital to analog conversion section was designed to faithfully duplicate all the sounds in the original source.

To help achieve that effect for all input resolutions, a dedicated asynchronous 32-bit / 192 kHz sample rate conversion is used. This way, the DAC stage’s anti-imaging filter is optimized for this sampling rate alone, resulting in an audio frequency range that’s unaffected in purity regardless of input format. In the process, the data gets reclocked, providing immunity from performance-marring source jitter.

Through the rest of the DAC circuitry, thin film high precision resistors and super low noise op-amps are used for lowest distortion, lowest noise, and most transparent sound. Other DAC units may boast about the performance of the DAC chip all by itself, but we view DAC stage design as a whole — there are no crippling bottlenecks anywhere in the DAC stage of the STR Preamplifier.

Aside from its cutting-edge technology, one look tells you that the STR Preamplifier is a different animal altogether. The display on the front panel gives you surprisingly easy control through an easy to navigate setup menu, and the luxurious new industrial design is available in two beautiful finishes, Black or Silver.

**More Subwoofer Options**

The STR Preamplifier gives you more options for subwoofer configuration. Use one subwoofer or two for both channels, or two independent right-and-left channel-specific subwoofers. The bass management in conjunction with ARC is uniquely engineered for seamless subwoofer blending, achieving incredibly accurate and lifelike performance.

**Moving Coil and Moving Magnet Phono**

Anthem has also taken into consideration the resurgent popularity of vinyl records, and has included separate inputs for moving magnet and moving coil cartridges, with the phono section completely shielded to maintain a clean signal. The transparency and refinement of the STR Preamplifier reveals the hidden magic of classic media. In addition, the phono curve is continuously adjustable for proper playback of any record that predates the RIAA equalization standard.

**Home Theater Bypass**

The concept of combining a stereo preamplifier with a home theater system is taken to a whole new level. The STR Preamplifier supports two subwoofer channels in addition to the two fronts. XLR as well as RCA connection is provided for all channels, and HT Bypass mode engages while the preamp is on standby. This way, you don’t have to turn it on when watching movies. To allow the purest signal path, relays are employed to hard-wire the input jacks to the outputs — the STR Preamplifier essentially becomes a straight wire.

**Premium Components**

Clarity is maintained using carefully selected components, many of them engineered exclusively in-house at Anthem. We believe that two-channel listening demands attention to detail, with flawless signal integrity being the benchmark of stereo performance. To that ultimate end, the Anthem STR Preamplifier is designed with the shortest possible signal paths, and differential analog to digital circuitry to cancel artifacts and keep noise to a minimum.
FEATURES

SUPERIOR CRAFTSMANSHIP
Solid build quality works in concert with clean, clear, audiophile-quality sound throughout the frequency spectrum.

Audio optimized for any space
The STR Preamplifier features exclusive Anthem Room Correction (ARC™) Technology. ARC uses a calibrated microphone and advanced DSP algorithms to quickly and easily optimize speaker performance in any space. In just a few easy steps the microphone measures sound output, compares it to scientifically optimal response curves, and instantly adjusts your settings for perfect sound. You’ll actually hear the difference ARC makes.

Correct your room acoustics using the method you are most comfortable with:

Requirements: iOS device
Download Anthem’s ARC™ Mobile app to an iOS device. Use the iOS device’s built-in microphone and measure five listening positions. It takes only minutes to complete.

Requirements: iOS device and the calibrated microphone
Download Anthem’s ARC™ Mobile app to an iOS device. Select “microphone” from the app menu, connect the supplied 3.5 mm cord from an iOS device to the ARC microphone with dual output jacks and measure five listening positions.

Requirements: PC, calibrated microphone and Anthem’s ARC™ software
Download and install Anthem’s ARC™ software to your PC. Use the supplied calibrated microphone, USB cord and your PC to run ARC. Connect PC to STR using the second USB cord or connect it through your local network. Measure up to ten listening positions and if desired, customize the results, set up multiple configurations and print the graphs.
